# Problem Statement

- How do we use technology to correlate data and information to inform the commander of developing risks and opportunities to ongoing missions to enable timely decision making?

# Overview

**Nearly all current data driven solutions reason for data integration but mainly fail to consider:**

- Existing (data and practice) workflows
- Data nuance, structure and automation
- Human: machine teaming efficiencies
- Appropriate AI/ML model design validation steps
- System resource requirements for data
- End user-centered design
- Historical data needs and archiving

# Current Execution Paradigms

**Most integrated platforms and solutions execute via:**

- Disconnected, force-fit API
- Data that doesn't inform
- Limited/absentee prediction/proactivity
- Information sans co-mingle (analysis/visualization)
- No/limited semi-automated data steps
- Failure to account for entropy/pattern of life
- Classification barriers by default as excuse
- Humans on wrong end of analysis timeline/s

# Proposed Way-Ahead

**Rethink data as an *opportunity* not capability problem:**

- Overtly ID/embrace challenge/s to solve
- Use/reuse all data at one's disposal by default
- Increase data confidence (threat, risk, opportunity)
- Find and introduce ways for data to inform each other
- Align data resourcing to reduce on-the-fly needs
- Embrace UI/UX that is familiar and intuitive
- Integrate then sunset existing offerings
- Train, educate, certify often...and upskill

# A Method to the Madness

## Create access not barriers to entry:

- Establish unified security structure with known user types (single sign-on, Zero Trust)
- Acknowledge HCMC a possibility
- Employ and nurture native (not post hoc) AI/ML
- Remove APIs in lieu of data import/export
- Make data provenance a mindset
- Staff accordingly and appropriately (integrators)
- Don't fear classification obstacles
- Create true tech roadmaps that are actionable

# Best Practice Philosophy

## Access is everything:

- Be mission centric!
- Build and sustain a core user base
- Create logical visualizations leading to decision points
- Be vendor agnostic
- Proactively build and test models
- Consider end ensure external validity
- Scale down costs over time
- Identify and execute ongoing T&E that sticks

# Thank You.
