

## Securing DoD Enterprise Innovation with ICAM

### Josh Brodbent

Senior Public Sector Security Director  
BeyondTrust

Agency modernization, expanding cloud deployments, and distributed workforces create new planes of privilege for adversaries to exploit. When designing the future state of The Defense Department's complex enterprise network, a least-privilege approach is critical to keep pace with adversaries and to lower your attack surface. With users and devices now accessing critical information, systems, and applications from anywhere, the mindset must be to never trust, always verify, and only allow privileged access when needed or contextual parameters are met.

Join BeyondTrust to understand why Privileged Access Management (PAM) is integral to secure the adoption of emerging initiatives across the government. Our cybersecurity expert will discuss:

- Why PAM is critical when developing programs like ICAM and EITaaS
- How Zero Trust, ICAM, and Enterprise Network Modernization correlate
- The path to secure modernization using least privilege or 'just-in-time' best practices
