

## **Experience-Driven NetOps – How Government Agencies Gain Network Visibility and Control**

### **Jeremy Rossbach**

Chief Technical Evangelist, NetOps Network Monitoring Solution

Broadcom

Join this session to learn how Centralized Command and Control in today's enterprise network demands end-to-end visibility of user experience with actionable insights to quickly resolve issues and achieve mission objectives. Recent years have brought a seismic shift in how government agencies manage digital connections. From the rapid move to hybrid work to the expanded use of cloud services and software-defined technologies, the nature of today's networks bears little resemblance to those that were in place just a few years ago.

There were times when it was enough to have a monitoring tool dedicated to checking LAN and WAN health in the agency's data center. Those times are over.

This session will review how network monitoring must reach services beyond the edge of the data center infrastructure; it must also provide application-level insights that correspond with the digital experience delivered to end users—whether they're agency employees, military or field personnel, or constituents.
